Adopting cutting-edge fleet software results in exceptional vehicle expense savings.

Challenge

Iberia is the leading carrier on routes between Europe and Latin America flying to 135 destinations in 47 countries in Europe, the Americas, Africa, Middle East and Asia. It operates over 2000 motorised assets of its fleet ground support equipment (GSEs) across 29 Spanish Airports.

Iberia wanted to test the Transpoco advanced fleet management solution on 200 ground support vehicles in Madrid (MAD) and Barcelona (BCN) airports with the view of rolling out across some other Spanish airports if successful.

Deployment

Transpoco installed its software on **2000 GSE** providing the functions of planning, scheduling, tracking and controlling the vehicles on the airport ramps. Thanks to the RFID driver log-in and GPS, Iberia were able to monitor vehicle activity, gain real time vehicle availability and provide an overall awareness of the total fleet usage.

Results

Iberia saw vehicle costs reduced by over 60%, fuel consumption by more than 10%and ensure 100%compliance with AENA regulations. Iberia has now awarded Transpoco the contract to implement the advanced fleet management solution on a variety of GSEs across numerous airports within its Spanish network.

In their words...

"The solution from **Transpoco** allows us to increase safety and performance on the ramp, being more environmentally friendly while reducing operational costs. The **Transpoco** system and team have been very flexible and agile in reaching the business specifications of our requirements".
Ángel Marcos, Iberia Chief Airport Services Officer.

Key Facts
- Flies to 135 destinations in 47 countries
- 2000 motorised vehicles across Spanish airport network
- 60% reduction in vehicle costs
- 10% reduction in fuel consumption
- 100% compliance with AENA regulations

60%
Reduction in vehicle costs
